

Brand & Visual Identity

One-page usage guide · v1.0 · July 2026

THE IDEA

A combination mark: a geometric “C” drawn as one continuous flowing channel, with a single bright **node** riding at its head — a patient tracked through the journey, from admission to follow-up. It ties the name, the “flow,” and the product’s central idea into one calm, ownable form that sits quietly in a dense clinical interface. Set in **Geist SemiBold**, the app’s own typeface, so the identity lives inside the design system rather than competing with it.

LOGO — PRIMARY

Primary · light canvas (#F8FAFC)

Primary · dark canvas (#020618)

Tagline lockup · “Every patient, every stage, in one view.”

Tagline lockup · dark

SYMBOL & MONOCHROME

Symbol · colour

Symbol · on dark

Monochrome slate · for reports

Monochrome white · reversed

The single-colour version (slate on light, white on dark) is the required form for exported operational reports and any one-ink context. The node stays a filled disc so the mark keeps its identity with no colour.

CLEAR SPACE & MINIMUM SIZE

Clear space = **x** on all sides, where x = the node diameter. Keep this margin free of type, rules, and other logos.

Minimum sizes — below these, use the symbol alone, never the full lockup:

Full lockup · **min height 24 px** on screen / 10 mm in print

Symbol only · **min 16 px** — verified legible at favicon size

The mark was tested down to 16 px and through the Android maskable crop — the symbol sits inside the central 80% safe zone, so it survives the circle and squircle masks.

BRAND COLOUR — “SIGNAL CYAN”

One signature colour added to the existing palette. It is a **bright, restrained cyan** — deliberately clear of the darker Diagnostics teal, the Boarding blue, and every triage hue. It is a **signature, not the action colour**: deep slate (#0F172B) remains the primary action colour; Signal Cyan marks identity, focus, and the logo.

Signal Cyan 500
#17C7D6
the brand accent

Signal Cyan 400
#3DDBE8
node · accent on dark

Signal Cyan 600
#0FB0C0
logo channel · accent on light

Patient-safety check. Measured in CIELAB against every reserved stage & triage colour, including simulated red-green colour-blindness, the accent stays clearly separated from all of them (nearest triage $\Delta E \approx 16$; nearest clinical colour, the Diagnostics teal, $\Delta E \approx 19$). It is never red, orange, amber, or green, and must **never** be used for anything that carries clinical meaning.

TYPOGRAPHY

Wordmark

CareFlow

Geist SemiBold, tracked -1.8%, outlined in the logo files

Interface

Geist Sans

headings & all UI text

Metrics / IDs

CMR-0247 · 36.8°C · 14:20

Geist Mono

No serif — the tone is instrument, not editorial. Keep the wordmark and interface in the same clean geometric-sans world so they never fight side by side.

APP ICON & FAVICON

App icon · rounded tile · 192 / 512 px

Maskable · full-bleed · mark in 80% safe zone

Apple touch · 180 px · opaque

Favicon · 16 / 32 / 48 px · SVG

Home-screen tiles use the deep-slate ground (#0F172B) so the icon reads as a calm instrument on any wallpaper, light or dark. Provided PNGs: 192, 512, 512-maskable, 180 Apple-touch, plus 16/32/48 favicons and an SVG favicon.

DO

- ✓ Keep it calm, precise, and credible — it lives next to live patient data.
- ✓ Give it clear space (x = node diameter) and respect the minimum sizes.
- ✓ Use the monochrome version for reports and any single-ink context.
- ✓ Use Signal Cyan as a signature accent; keep slate as the action colour.
- ✓ Trust it to work identically in English and French — the mark carries no words.

DON'T

- ✗ Recolour the mark into any reserved stage or triage colour.
- ✗ Add a red cross / crescent, stethoscope, caduceus, or ECG-heart.
- ✗ Stretch, rotate, add shadows/gradients, or reflow “CareFlow” into “Care Flow”.
- ✗ Place the full lockup below 24 px — use the symbol alone instead.
- ✗ Let the mark shout: no glow, no busy or “techy” embellishment.
